

The Eye News Twelve Days of Christmas

On the first day of Christmas, my true love gave to me...

A #RyderCup globe injury

An unfortunate spectator was hit in the eye by a wayward golf ball during the Ryder Cup, and suffered, as she called it, "a fracture of the right eye socket and an explosion of the eyeball" [1]. She alleges that no warning was given, and she intends to pursue legal action. The Ryder Cup spokesperson, however, has confirmed that the marshalls had indeed called "fore" several times, but appreciated that accidents could still happen [1].

On the second day of Christmas...

#RobertoFirmino

Liverpool striker Roberto Firmino was accidentally poked in the eye by Tottenham player Jan Vertonghen. The picture is quite dramatic, appearing as though Vertonghen's finger is gouging Firmino's left eye out of the socket [2]. Luckily Firmino only suffered from superficial injuries [3].

On the third day of Christmas...

#Transitionscontactlenses

Transitions Light Intelligent Technology allows for adjustable lens tinting, as per ambient lighting. Now, they have teamed up with Acuvue Oasys to create two weekly spherical contact lenses with the same light adaptive technology. They are due to be launched in 2019 [4]. Note that since they will only cover the cornea to just beyond the limbus, they are not an exact replacement for sunglasses.

On the fourth day of Christmas...

#ZoggsFogbuster

Zoggs had issued a recall of their Fogbuster anti-fog gel for goggles. However, it was not widely publicised, nor was it clear about the extent of potential damage use of the product could cause. Queensland swimmer Darren Lydeamore went for a routine morning swim, and applied the gel to his goggles. He was unaware of the product recall. His treating doctor described his ocular injuries similar to those seen with acid injuries. Zoggs has since then said they will permanently discontinue the product [5].

On the fifth day of Christmas...

#Bemyeyes

The Be My Eyes app is a free app that connects visually impaired people to sighted volunteers [6]. Volunteers get a notification on the app when a visually impaired person requests help, and can choose to accept. The average response time is 30 seconds. It can be anything from helping to locate a lost item, read a phone number, or narrating major life

events. The idea from the app came from Hans Jorgen Wiberg, who has retinitis pigmentosa, and says that one day he himself will need the app.

On the sixth day of Christmas...

#glaucomadrugs for #weightloss

Scientists accidentally created a mouse which could gorge itself on a high fat diet but gain no weight. They discovered that inactivation of two endothelial cell receptors (neuropilin-1 and vascular endothelial growth factor receptor 1) induced zippering of lacteal junctions, thereby inhibiting chylomicron absorption. It turns out that Rho kinase (ROCK) inhibitors induce this same lacteal zippering, and these are a new class of anti-glaucoma medication currently available in Japan, China and the USA. However, some would caution that zippering up the lacteals may have the unwanted side-effects of impairing immune cell trafficking, compromising fluid drainage, and malabsorption of essential fat soluble vitamins [7,8].

On the seventh day of Christmas...

#Siberianhuskyblueeyes

Siberian huskies were the subject of the first non-human consumer genomics study, to determine why they have such piercing blue eyes. It seems the answer is due to a duplication upstream of Homeobox gene ALX4 on chromosome 18 [9,10].

On the eighth day of Christmas...

#bluelightkillsretina

Scientists from the University of Toledo discovered that when blue light interacts with retinal (11-cis and all-trans), cytotoxicity in any body cells, including retinal photoreceptors, is induced [11]. This implies that modern living, with increasing dependence on LED screens, may increase the prevalence of macular degeneration. Perhaps in the future we will all be wearing blue light filtering sunglasses when we work on our computers.

On the ninth day of Christmas...

#gentlesteameyemask

MegRhythm Gentle Steam Eye Masks are Japanese self-heating eye masks producing a warm gentle steam to "soothe hard-working eyes" (as per the box). An allergy sufferer writing for *Elite Daily* claimed the masks cured her allergy face [12]. Beauty editors and aficionados can't get enough of them, with rave reviews in *Allure*, *InStyle*, and *Women's Health* magazines [13-15].

On the tenth day of Christmas...

#AirNewZealandbirdmask

If you fly business class with Air New Zealand,

you'll get a funky 'bird mask' to help you fight jet lag. It is a luxurious re-usable sleeping eye mask made of sustainable New Zealand merino wool and a castor bean oil-based foam. The design features a birdlike beak, hence the name, however, this feature seals the mask to the face, thereby completely blocking out the light [16].

On the eleventh day of Christmas...

#noseblowfracturedeye

This North London woman managed to cause an orbital blowout fracture by blowing her nose too hard. She presented with nose bleed, vision loss and facial pain and swelling. Nose blowing does not typically cause this injury, but her doctors think she must have a predisposing skeletal weakness in the area, which may have been contributed by her heavy smoking habit [17].

On the twelfth day of Christmas...

#husbandlearnswife'smakeup

This story will give you all the feels. An 84-year-old man has learned to do his wife's makeup because she's going blind [18]. He started taking makeup lessons at his local Debenhams store after she started to struggle to apply it herself. He just wants her to "feel good" even when she's losing her sight.

So all together now, if you use your imagination, you might just make it fit the melody!

On the twelfth day of Christmas...

My true love gave to me
